Errata / Corrections for QATTP

- Unsupported properties do not throw a **Bad Request** as this was decided to be kept to ensure backward compatibility is met between different client versions.
- Two new supported properties are able to be sent on the **Type** header by the client: **Convex** and **Concave.** Only Quad's support this property.
- In the QATTP protocol, "This filter header asks the server to only return shapes from the data set that have been sent exactly n times before"
  - This is not correct. It should instead read: "This filter header asks the server to only return shapes from the data sets that have been sent **at least** n times before."
